

Faderfox LC2 / MIDI Setup for Modul8

Version 1 (c) 2007 [eyetrapp.net/fosfor](http://www.eyetrapp.net/fosfor)

Additional Information

This manual gives a suggestion how to set up the Faderfox Microcontroller LC2 for Modul8. There are many more possibilities to map Modul8 controls to the LC2; you may come up with a totally different approach. You are invited to share your experiences with me and ask questions via <http://www.eyetrapp.net/fosfor>.

In this setup, all controls are assigned to global parameters.

For layer-specific parameters, the LC2 can be combined with a Faderfox LD2 with endless encoders. See reference at <http://www.eyetrapp.net/hardware>

Concerning the Pot control (upper right buttons):

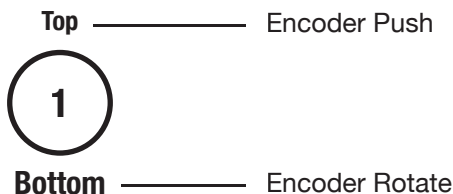

When using the „Send“ mode, a push to the encoders sets the value to zero.

In „EQ“ mode the push sets the value to 50%. (Best switch to Send or EQ immediately after power on; using „Main“ mode may be confusing because it refers to audio tracks in Traktor software.)

In the lower button section you can use two different sets (green or red).

Be aware that the midi mapping for faders and encoders just works in the set in which it had been programmed (green OR red).

For further reference also check out <http://www.faderfox.de> and the LC2 manual.

Version 1 (c) 2007 eyetrapp.net/fosfor

Additional Information

Screenshot of the described Midi mapping in Modul8.

The LC2 can not be programmed but sends fixed midi signals. These can easily be mapped to controls in Modul8.
